# ABSTRACT

This report describes the operation of the Uinta Basin Seismological Observatory (UBSO) from 1 August through 31 October 1966. Modifications and additions to the observatory instrumentation are described, and tests to improve the operation of the observatory are reported. Also discussed is the status of special investigations designed to evaluate and improve the detection capability of the observatory.

### OPERATION OF UBSO

### 1. INTRODUCTION

### 1.1 AUTHORITY

The work described in this report was supported by the Advanced Research Projects Agency, Nuclear Test Detection Office, and was monitored by the Air Force Technical Applications Center (AFTAC) under Contract AF 33(657)-16563. The Statement of Work for this contract is shown in appendix 1.

### 1.2 HISTORY

UBSO was constructed under Contract AF 33(657)-7185. Site selection and noise surveys were accomplished by Teledyne Industries, Geotech Division, (formerly The Geotechnical Corporation); the final decision on the observatory location was made by AFTAC. Texas Instruments, Incorporated (TI) was responsible for the construction of all physical facilities.

Contract AF 33(600)-43486, issued to TI, contained the authority for equipping and operating UBSO. The instrumentation was supplied by Geotech and was installed under the direction of Geotech personnel under subcontract to TI. TI operated the observatory from November 1962 until 1 July 1963. Under Projects VT/1124 and VT/5054, Contract AF 33(657)-12373, Geotech operated UBSO from 1 July 1963 through 30 April 1966.

# 2. OPERATION OF UBSO

### 2.1 GENERAL

Data are recorded at UBSO on a 24-hour basis. The observatory is normally manned 8 to 10 hours a day, 5 days a week. On weekends and holidays, a skeleton crew mans the observatory 8 hours a day; however, additional personnel are on call in case of an emergency.

### 2.2 SEISMOGRAPH OPERATING PARAMETERS

# 2.2.1 Standard Seismographs

The operating parameters and the tolerances for the standard observatory seismographs are shown in table 1. These parameters are reset, as necessary, when the frequency response of a seismograph is found to be out of tolerance. The frequency response norms and their respective tolerances are shown in table 2. The frequency responses of the UBSO seismographs, as normally operated, are shown in figure 1.

# 2.2.2 Filters for Multi-Channel Array Processors (MAP)

All MAP data utilize a band-pass filter with the following settings: high-cut frequency of 3 cps at 3 dB per octave cutoff rate, and a low-cut frequency of 1 cps at 12 dB per octave cutoff rate.

### 2.2.3 Filters for Array Summations

Summations of the 10-element surface array and the shallow-buried array are each filtered by a band-pass filter with the following settings: high-cut frequency of 3 cps and low-cut frequency of 0.8 cps, both at a cutoff rate of 18 dB per octave. The six-elements of the vertical array are summed and two filtered outputs are recorded in Data Group 5056. One of the outputs ( $\Sigma$ DH) is filtered at 5 and 0.375 cps, both at a rate of 24 dB per octave; the second output ( $\Sigma$ DHF) is filtered at a high-cut frequency of 3 cps and a rate of 24 dB per octave, and a low-cut frequency of 0.75 cps and a rate of 36 dB per octave.

### 2.3 DATA CHANNEL ASSIGNMENTS

Several recording format changes were made during this reporting period. Data Group 5046 was established on 28 July, and test recordings of elements of vertical array began on 16 September. This Data Group was changed on 8 September to Data Group 5056. Data Group 5054, MAP II, was initiated on 27 September, providing for additional MAP recordings. The current data channel assignments for all UBSO data groups are shown in table 3. The key to the designators used in the data channel assignments is given in table 4.

### KEY

R. M. Relative magnification A. T.

Amplitude tolerance

Tolerance not established in the period Measurements not reliable due to interference

from microseismic background noise

These norms and tolerances, apply to the broad-response long-period system (LP1).

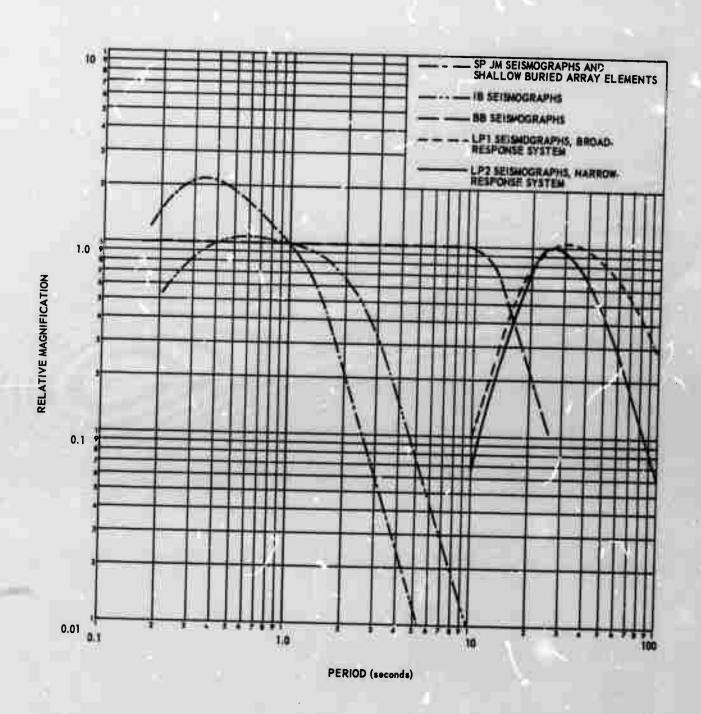

Figure 1. Normalized response characteristics of the standard seismographs at UBSO

G 1.58

# 2.4 SHIPMENT OF DATA TO THE SEISMIC DATA LABORATORY (SDL)

Magnetic-tape seismograms are shipped to SDL with the regular Long Range Seismic Measurements (LRSM) Program data shipment about 15 days after the end of the month during which they were recorded. The magnetic-tape seismograms recorded at UBSO through 30 September have been shipped to SDL.

All 16-millimeter film seismograms recorded at UBSO through 31 March were sent to SDL. More recent films are currently held in Garland for special studies.

### 2.5 QUALITY CONTROL

# 2.5.1 Quality Control of 16-Millimeter Film Seismograms

Quality control checks of randomly selected runs of 16-millimeter film from the shallow-buried array, the surface array, and the long-period seismograph, and the associated operating logs are made in Garland. Items that are routinely checked by the quality control analyst include:

- a. Film boxes neatness and completeness of box markings;
- Develocorder logs completeness, accuracy, and legibility of logs;
- c. Film:
- (1) Quality of the overall appearance of the record (for example, trace spacing and trace intensity);
  - (2) Quality of film processing;
- d. Analysis completeness, legibility, and accuracy of the analysis sheets.

Results of these evaluations are sent to the observatory for review and comment by the observatory personnel.

# 2.5.2 Quality Control of the Magnetic-Tape Seismograms

Routine quality control checks of randomly selected magnetic-tape seismograms are made in Garland to assure that recordings meet specified standards. The following are among the items that are checked by the Quality Control Group.

- a. Tape and box labeling;
- b. Accuracy, completeness, and neatness of logs;
- c. Adequate documentation of logs by voice comments on tape where applicable;
  - d. Seismograph polarity;
  - e. Level of calibration signals;
  - f. Relative phase shift between array seismographs;
  - g. Level of the microseismic background noise;
  - h. Level of the system noise;
  - i. PTA dc balance;
  - j. Oscillator alignment;
  - k. Quality of the recorded WWV signal where applicable;
  - 1. Time pulse carrier;
  - m. Binary coded digital time marks.

### 2.6 SECURITY INSPECTION

Mr. William J. Robertson, Industrial Security Specialist, visited the observatory on 27 September for a facility security inspection. All observatory security procedures were found to be in order.

### 2.7 CABLE REPLACEMENT SURVEY

A summary of the replacement of spiral-four cable at UBSO for the interval of 1 July 1963 through 18 October 1966 was sent to the Project Officer at

his request. Only 11 reels of cable were replaced during this time (39-1/2 months).

### 2.8 SAFETY INSPECTION

Mr. Kenneth E. Abel, of Atwell, Vogel, and Sterling, visited UBSO on 28 September to conduct a safety inspection for workmen's compensation insurance. No dangerous conditions were found.

# 3. MAINTENANCE OF EQUIPMENT

# 3.1 TIMING SYSTEM, GEOTECH MODEL 11880

The UBSO Timing System, Geotech Model 11880, became inoperative on 15 October. A spare drive motor for the stroboscope was sent from Garland and installed. The unit was returned to service.

### 3.2 STORM DAMAGE

A severe lightning storm on 20 August broke the galvanometer suspension in the Z2 seismograph. This circuit was protected by AEI lightning protectors.

Four telephone poles, located approximately three-fourths mile north of UBSO, were split by lightning during a storm on 1 September. None of the observatory instrumentation was damaged by this storm, however. The only effect of the storm at the central recording building was two blown fuses in the telephone junction box.

# 3.3 FLOODING OF DEVELOCORDER

There have been instances of flooding of the Develocorders during the reporting period. This flooding was the result of a buildup of a heavy slime in the processor drip-tray drain, clogging the drain. Samples of the slime, taken by representatives of the Utah State Health Department, were found to be 90 percent inorganic. An evaluation of means to combat this slime build-up is currently in progress.

# 4. MAINTENANCE OF UBSO FACILITIES

### 4.1 SURFACING OF UBSO ACCESS ROAD

Surfacing of the UBSO access road was accomplished during the reporting period. Project VT/6705 paid the cost of hauling 5783 cubic yards of haive asphalt (less than \$4500), and the cost of spreading and rolling the asphalt was borne by the Uinta County Highway Department. All work on the road was completed by 9 September.

We expect the newly surfaced road to be a valuable asset to the observatory and to facilitate access to the station during the winter and spring months when snow and bad weather have created hazardous driving conditions in the past.

### 4.2 AIR CONDITIONING SYSTEM

The observatory air conditioning system has intermittently given problems and we have never considered the efficiency of the system to be adequate. Since the system was installed, routine checks and services have been furnished by a local representative. In August, when the No. 1 compressor was determined to be inoperative, a representative of Craighead Plumbing and Heating Company of Provo, Utah, was contacted to inspect and repair the system. Following is a list of problems that were found and corrected.

- a. Burned-out solenoid coil in the refrigerant line of compressor No. 2.
  - b. Burned-out starter heater in system No. 1.
- c. No. 1 system out of refrigerant due to broken weld on compressor muffler.
  - d. High pressure gauge on No. 1 compressor was inoperative.
  - e. Winterstat and check valve was stuck on system No. 1.
- f. The drive belts on both compressors, the air handling fan, and the condensor fan were in very bad condition.
- g. The air filters had not been serviced since the unit was installed and in addition, the filters had been installed backwards.
  - h. The No. 2 system was low on refrigerant.

- i. The motor pulley threads were stripped on the air handling unit; the fan was being driven by only one belt.
- j. The system has a very small eifferential between heating and cooling; however, this may be a design error. The office and shop thermostats must be set to a lower temperature (about 68°F) to maintain the desired 72°F temperature in the console area.

The winterstat and check valve assembly on system No. 1 had to be removed and the refrigerant routed directly into the condenser coils because no replacements were readily available. The repairman recommended that these valves be permanently bypassed.

From this experience we have decided that we will use the Provo representative in the future instead of the local service man because we do not believe that adequate service has been furnished in the past.

### 4.3 MISCELLANEOUS

The water damaged ceiling on the entry overhang of the observatory building was removed and the primed structural members were painted.

The exposed surface of the deep, long-period vault was painted. New water shields were constructed, painted, and installed around the shallow-buried array PTA vaults.

# 5. FIRE IN MECHANICAL ROOM OF OBSERVATORY

Fire broke out in the mechanical room of the observatory at about 7:00 p.m., MST, on Sunday, 28 August. Mr. Nils Hofmann, UBSO Station Engineer, who was working in the vicinity of the observatory after normal working hours, took rapid and effective measures to extinguish the fire. His presence of mind, undoubtedly, prevented more extensive damage to, or total loss of, the observatory.

The fire started when the high-pressure regulator, located at the gas-storage tank, failed. This allowed gas to flow into the building under high pressure. Failure of the high-pressure regulator caused the subsequent failure of the low-pressure regulators located at the boiler and the household water heater. The diaphragms of the low-pressure regulators ruptured and the escaping gas was ignited, probably by the pilot light of the household water heater. No back-up, high-pressure regulation was provided with the original UBSO

system; however, we have had a back-up system installed to preclude a recurrence of this type of trouble.

Damage resulting from the fire was limited to the mechanical room except for some superficial smoke and heat damage to the operations room at the door to the mechanical room. Much of the wiring to the air conditioning controls was burned and some of the air circulating motors were burned. No damage occurred to the seismographic instrumentation as a result of the fire.

The air conditioning was restored on a temporary basis by station personnel who wired around the burned portion of the circuit. Arrangements to restore the critical systems to normal were made within a few days. Bids for repair of all other fire damage were requested and let. Repair of fire damage is almost complete at this time.

# 6. EVALUATE DATA AND DETERMINE OPTIMUM OPERATIONAL CHARACTERISTICS

# 6.1 MODIFICATION TO UBSO INSTRUMENTATION

### 6.1.1 Modified Line Termination Module

On 2 August, the modified line termination module was installed in Z1 and a modified line termination module with an inductor protector was installed in Z5. No conclusive data regarding the effectiveness of either the modified line termination module or the inductor protector are available at this time.

# 6.1.2 Adjustable Period PTA Galvanometers

Six short-period, adjustable-period, PTA galvanometers were installed in the surface array seismographs. The galvanometers that were replaced were returned to our Garlard laboratory for modification to the adjustableperiod configuration.

# 6.1.3 Power Amplifier, Model 22183

A newly designed Power Amplifier, Model 22183, was delivered to UBSO, the prescribed preinstallation tests were performed, and the unit was installed. The amplifier would not start under an appreciable load; however, the unit would carry a load of up to 750 watts if the unit was started under a small load and the load was gradually increased. The amplifier was operated under a load of about 300 watts, but frequent intermittent shut-downs were

experienced. The unit was returned to Garland for inspection and repair.

Temporarily, a 60-watt Power Amplifier, Model 9231, was installed (see figure 2) as an emergency measure and to provide a back-up system for possible addition of Develocorders and Helicorders. The magnetic-tape recorders are operated on unregulated line power.

After inspection in Garland, the Model 22183 amplifier was modified by increasing the drive to the silicon control-rectifiers. Also, a short between one of the fan mounting screws and a heat-sink fin, that resulted from shipping damage was repaired. The unit was returned to UBSO and reinstalled on 31 August.

Evaluation of the Model 22183 power amplifier was again interrupted due to component failures. These failures occurred while the timing system was being adjusted. The power amplifier was returned to our Garland laboratory. Environmental tests in Garland indicated malfunction of several components, and the short-circuit protection system required a slight modification. Laboratory tests indicated that after modification, the power amplifier was performing satisfactorily. The unit was reshipped to UBSO, late in October.

# 6.1.4 Telephone Link to Deep-Well Site

A permanent telephone link was routed to the deep-hole site using scrap sections of spiral-four cable. This was done to provide a reliable communications link between the central recording building and the deep-hole site. The cable was terminated at the vertical array PTA hut and jumpers were installed to both winches.

# 6.1.5 Gasoline-Powered Generator

A 6.3 KVA gasoline-powered generator was delivered to UBSO from the Large Aperture Seismic Array (LASA) Maintenance Center on 14 September. We had planned to use this generator in the UBSO system to supply standby power for charging the batteries during prolonged commercial power failures. The motor, however, is a hand-cranked unit and no provision has been made for automatic starting; consequently, the generator would be useful only if station personnel were present when a power failure occurred. At the present time, we do not plan to modify the motor for automatic starting.

# 6.1.6 New Program for Data Group 5052 (MAP I)

The printed circuit boards for the new program in the MAP I system was received and the boards were installed in MCF-1. The modified MCF-1 became operational on 20 October and will subsequently be designated MCF-4. On 24 October, MCF-2 program was removed and the old MCF-1 program was installed in its place to facilitate direct comparison of the new and old

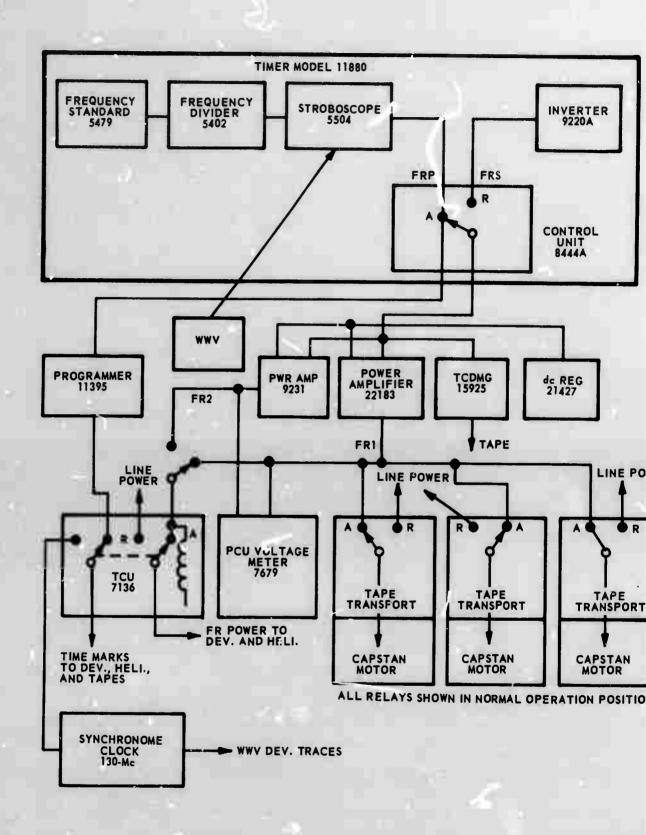

Figure 2. Block diagram of UBSO power system

MCF-1 programs. Figures 3 through 10 show these comparisons. Note that at times MCF-4 (the modified program) is little or no better than the old MCF-1. UBSO personnel forwarded pictures of all short-period seismograms illustrating the effectiveness of the MCF-4 program to the Project Officer.

# 6.2 ADDITIONAL INSTRUMENTATION AT UBSO

# 6.2.1 Six-Element Vertical Array

The first string of three seismometers of the six-element vertical array was installed in the Carter Oil Company, No. 6 Vernal (figure 11) near the end of the last reporting period. The top string of three seismometers of the vertical array was lowered into the deep hole early in this reporting period. The string was not set in the hole, however, because of a malfunction of the holelock motor of seismometer No. 4.

The string of seismometers was removed and the holelock motor on the No. 4 seismometer was repaired. The first and second jumpers were connected and reinstallation of the second string of seismometers was started. When the No. 4 seismometer was at a depth of about 1,000 feet, the connector between the first and second jumpers parted, allowing both the seismometer and a 1000-foot length of cable to drop into the hole. We thought it might be possible to clean the hole by raising the bottom string of seismometers. The string was raised about 80 feet, but the cable parted under a load of about 8,000 pounds, at a depth of between 3700 and 3800 feet. The cable parted at a point damaged by the falling seismometer. A fishing rig was contracted to move onto the hole, and fishing began on 7 August. All equipment was retrieved in eight trips, all in one day.

Repair of the seismometers and spooling of new cable onto the winch was started by 13 August. Reinstallation of the bottom string of seismometers was completed and test data were being recorded by 30 August. The top three seismometers were installed by 5 September. The elements are set in the hole as follows:

Seismometer	Depth				
No. 6	3907 feet				
No. 5	4901 feet				
No. 4	5894 feet				
No. 3	6910 feet				
No. 2	7903 feet				
No. 1	8895 feet

UBSO

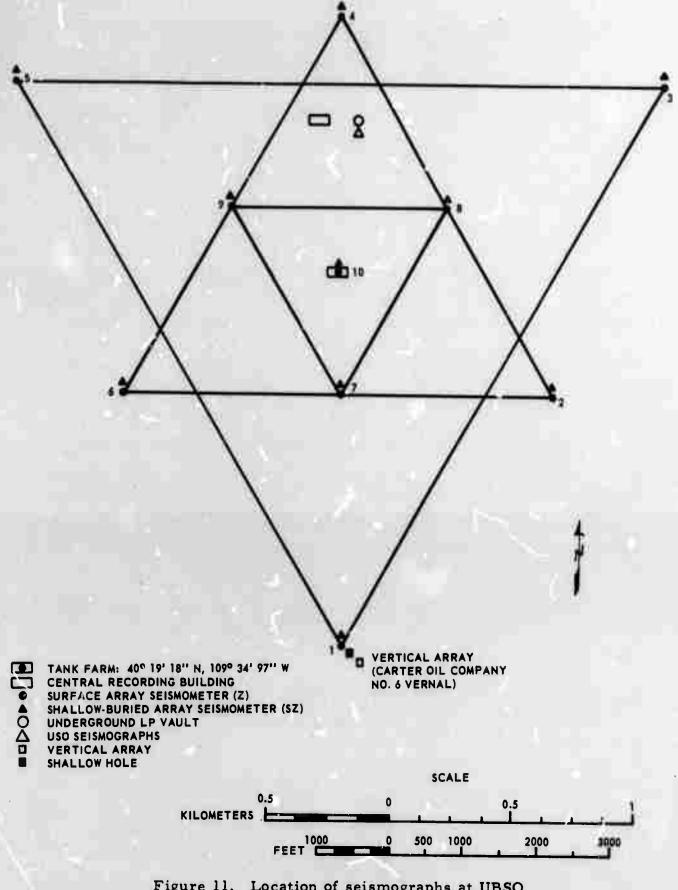

Figure 11. Location of seismographs at UBSO

G 1839

Some noise problems experienced immediately after completion of the installation of the seismometers were eliminated by moving the PTA's from the wellhead into the central recording building. By the end of the reporting period all seismograph channels were operating, the sensitivity of the Develocorder galvanometers had been equalized, and the seismograph frequency responses were being checked. Figures 12 through 15 show the response of vertical array seismographs to typical noise and signals.

## 6.2.2 Additional MAP Units

Data Group 5054 (MAP II) became operational early in October. MAP outputs of the shallow-buried and vertical arrays are included in this data group. Figures 16 through 21 show the response of MAP II to typical noise and signals at UBSO. Primary short-period data corresponding to the noise data shown in figures 17 and 18 are shown in figures 22 and 23. Vertical array seismograms of the earthquakes shown in figures 13 through 15 are shown in figures 19 through 21.

## 7. ANALYZE DATA

### 7.1 GENERAL

Effective I August, determinations of event arrival times, periods, and amplitudes for routine daily analysis are made from seismograms of the shallow-buried array.

## 7.2 REPORT EVENTS TO U. S. COAST AND GEODETIC SURVEY (USC&GS)

Analysts daily report the time of arrival, period and center-to-peak ground displacement of events recorded at UBSO to the Director of USC&GS in Washington, D. C. The number of events, by type, reported by UBSO during each month in this reporting period is shown in table 5. The total number of events recorded by the observatory, the number of epicenters determined by USC&GS and reported in the "Earthquake Data Report", and the percentage of the hypocenters in which UBSO data were utilized, are shown in table 6 for March through July 1966. Lists of more recent epicenters have not been completed by USC&GS.

## 7.3 DAILY ANALYSIS FOR MULTISTATION EARTHQUAKE BULLETIN

Data from UBSO are combined with data from BMSO, CPSO, TFSO, and WMSO and published in a monthly multistation earthquake bulletin. The

May 1966	1246	442	71.0
June 1966	1467	446	65.0
July 1966	1597	338	79. 1

bulletins for March, April, and May 1966 were published during this reporting period.

The raw data for June and July were transcribed onto digital magnetic tape and sent to SDL for processing. Errors in June input data were discovered during processing of the data for Automated Bulletin Process (ABP). These errors were corrected and the data have been resubmitted for ABP processing.

The check program for raw data was revised to flag errors of the type occurring in the June data, and all subsequent raw data will be checked for these error types.

Data for August and September have been transcribed onto tape, and will be checked and sent to SDL for processing. Keypunching of October raw data is about 50 percent complete.

#### 7.4 CONTINUE NOISE SURVEY

Measurements of ambient noise in the 0.4 to 1.4 second period range are made daily at UBSO. Data are processed in Garland, and monthly cumulative probability curves of trace amplitude and ground displacement are published. Noise data are reported from the Z10, SZ10,  $\Sigma T$ ,  $\Sigma \Sigma T$ ,  $\Sigma T F$ , and  $\Sigma \Sigma T F$  seismograms. Curves for the months of June, July and August were sent to the Project Officer during this reporting period.

# 8. PROVIDE OBSERVATORY FACILITIES AND ASSISTANCE TO OTHER ORGANIZATIONS

#### 8.1 MONITOR OF SANDIA'S USO

We began recording the outputs of the Sandia Unmanned Seismological Observatory (USO) seismographs late in the last reporting period; however, excessive amounts of 60 cps and 10 cps noise were noted on the USO seismograms. Sandia was notified, and they requested that we install a 10 microfarad capacitor across the output lines. Installation of the capacitor, however, afforded no noticable improvement in the seismograms. Messrs. Kreitter and Linn, Sandia representatives, visited UBSO on 15 through 17 August to investigate methods of eliminating the noise.

The noise occurring at 60 cps, generated within the USO, was reduced by the Sandia personnel; however, 5 to 6 volt ac potential between the USO ground and the observatory ground accounts for the 60 cps noise now

observed on the Develocorder traces. While this noise does not interfere with UBSO's monitoring assignment, the seismograms are useless for conventional measurements.

The cause of the 10 cps noise on the film seismograms has not yet been determined. Based on a comparison of the frequency responses, relative operating magnifications, and seismograms of the short-period USO seismographs and the shallow-hole, high-frequency seismograph previously operated at UBSO, it is our opinion that a part of this 10 cps noise is not seismic noise but is generated in the USO system.

When Sandia personnel were working with the USO time encoder during their August visit, the year code was inadvertently changed to 1967. Sandia was notified of this condition.

On 8 September, Sandia representatives visited UBSO to inspect the USO and to troubleshoot malfunctions reported to them. They left the observatory on 9 September. Subsequently, we discovered that no data were being supplied to either the short-period vertical or north-south outputs and that the USO time code was in error by 12 hours. No automatic calibration pulses were put on USO data beginning on 26 September. Sandia was notified of these problems, and on 17 October, Sandia representatives arrived at UBSO. The magnetic-tape recorder which was not operating was replaced, other minor problems were corrected, and all USO seismographs appeared to be functioning properly at the end of the reporting period.

Special recordings of the USO seismographs were made on 24 and 25 August at the request of the Project Officer. These seismograms were from the USO long-period vertical, short-period vertical, and short-period east-west seismographs.

Location of the USO seismographs is shown in figure 11.

### 8.2 COOPERATE WITH USC&GS

In addition to the routine messages, UBSO cooperates with the USC&GS in providing information on specified events. One example of this is the reporting of aftershocks of the Utah event of 16 August. All analysis data on this series of shocks were sent to Mr. Ken Bayer of the USC&GS in Rockville, Maryland.

UBSO recorded and reported a total of 399 events of this swarm from 16 through 25 August.

### 8.3 UNIVERSITY OF UTAH

UBSO supplied data to the University of Utah concerning the earthquakes in southwestern Utah and in other areas, including the large earthquake in the Lake Tahoe area on 12 September.

#### 8.4 VISTORS

Several representatives from Sandia Corporation were vistors at UBSO during this reporting period.

Messrs. Ariel Michie and Edgar M. Hays, Utah State Health Department, visited UBSO on 20 September \* sample the Develocorder slime build-up for chemical analysis.

A professor and eight students from Rangely College visited the observatory in October.

## 9. REPORTS

The UBSO Quarterly Report No. 1, Technical Report No. 66-84, was mailed to the Project Officer on 25 August.

## APPENDIX 1 to TECHNICAL REPORT NO. 66-102

## STATEMENT OF WORK TO BE DONE

AFTAC Project Authorization No. VELA T/6705

#### EXHIBIT "A"

## STATEMENT OF WORK TO BE DONE

AFTAC Project Authorization No. VELA T/6705/S/ASD (32)

#### 1. Tasks:

8 February-1966

#### a. Operation:

- (1) Continue operation of the Uinta Basin Seismological Observatory (UBSO), normally recording data continuously.
- (2) Evaluate the seismic data to determine optimum operational characteristics and make changes in the operating parameters as may be required to provide the most effective observatory possible. Addition and modification of instrumentation are within the scope of work. However, such instrument modifications and additions, data evaluation, and major parameter changes are subject to the prior approval of AFTAC.
- (3) Conduct daily analysis of seismic data at the observatory and transmit daily seismic reports to the US Coast and Geodetic Survey, Wash DC 20230, using the established report format and detailed instructions.
- (4) Record the results of daily analysis on magnetic tape in a format compatible with the automated bulletin program used by the Seismic Data Laboratory (SDL) in their preparation of the seismological bulletin of the VELA-UNIFORM seismological observatories. The format should be established by coordination with SDL through AFTAC. The schedule of routine shipments of these prepared magnetic tapes to SDL will be established by AFTAC.
- (5) Establish quality control procedures and conduct quality control, as necessary, to assure the recording of high quality data on both magnetic tape and film. Past experience indicated that quality control review of one magnetic tape per magnetic tape recorder at the observatory each week is satisfactory unless quality control tolerances have been exceeded and the necessity of additional quality control arises. Quality control of magnetic tape should include, but need not necessarily be limited to, the following items:
  - (a) Completeness and accuracy of operation logs.
- (b) Accuracy of observatory measurements of system noise and equivalent ground motion.
  - (c) Quality and completeness of voice comments.
- (d) Examination of all calibrations to assure that clipping does not occur.
- (e) Determination of relative phase shift on all array seismographs.

REPRODUCTION

#### EXHIBIT "A"

- (f) Measurement of DC unbalance.
- (g) Presence and accuracy of tape calibration and alignment.
- (h) Check of uncompensated noise on each channel.
- (i). Check of uncompensated signal-to-noise of channel 7.
- (j) Check of general strength and quality of timing data derived from National Bureau of Standards Station WWV.
- (k) Check of time pulse modulated 60 cps on channel 14 for adequate signal level and for presence of time pulses.
- (1) Check of synchronization of digital time encoder with
- (6) Provide observatory facilities, accompanying technical assistance by observatory personnel, and seismological data to requesting organizations and individuals after approval by AFTAC.
- (7) Maintain, repair, protect, and preserve the facilities of the seismological observatory in good physical condition in accordance with sound industrial practice.
- b. <u>Instrument Evaluation</u>: After approval by AFTAC, evaluate the performance characteristics of experimental or off-the-shelf equipment offering potential improvement in the performance of observatory seismograph systems. Operation and test of such instrumentation under field conditions should normally be preceded by laboratory test and evaluation.
- c. Special Investigations: Conduct research investigations as approved or requested by AFTAC to obtain fundamental information which will lead to improvements in the detection capability of UBSO. These programs should take advantage of geological, meteorological, and seismological conditions at UBSO. The following special studies should be accomplished.
  - (1) Long term evaluation of the multiple array processor units.
  - (2) Installation and evaluation of a vertical array.
  - (3) Evaluation of the long-period vault.
- (4) Provide technical assistance and monitor an unattended seis-mological observatory to be installed at UBSO in June 1967.

Research might pursue investigations in, but is not necessarily limited to, the following areas of interest: microseismic noise, signal characteristics, data presentation, detection threshold, and array design (surface and shallow borehole). Prior to commencing any research

### EXHIBIT "A"

investigation, AFTAC approval of the proposed investigation and of a comprehensive program outline of the intended research must be obtained.

- 2. Approval by AFTAC will normally be provided through the project officer.
- 3. Reports: Provide reports in accordance with the/requirements outlined in DD Form 1423 and attachment 1 thereto.

13 ABSTRACT					

This report describes the operation of the Uinta Basin Seismological Observatory from 1 August through 31 October 1966. Modifications and additions to the observatory instrumentation are described, and tests to improve the operation of the observatory are reported. Also discussed is the status of special investigations designed to evaluate and improve the detection capability of the observatory.

unclassified Security Classification

#### INSTRUCTIONS

- 1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, aubcontractor, grantee, Department of Defense activity or other organization (corporate suthor) issuing the report.
- 2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in secondance with appropriate security regulations.
- 2b. GROUP: Automatic downgrading is specified in DoD Directive 5200. IO and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
- 3. REPORT TITLE: Enter the complete report title in all capital lettera. Titlea in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
- 4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive datea when a specific reporting period is covered.
- 5. AUTIOR(S): Enter the name(s) of author(a) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
- 6. REPORT DATE: Enter the date of the report as day, month, year; or month, year. If nore than one date appears on the report, use date of publication.
- $7_{\mathcal{O}}$ . TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.
- 7b. NUMISER OF REFERENCES: Enter the total number of references cited in the report.
- 8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contrac' or grant under which the report was written.
- 8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, aystem numbers, task number, etc.
- 9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).
- 10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further disaemination of the report, other than those

imposed by security classification, using standard statements such as:

- (I) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC; users shall requeat through
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

- II. SUPPLEMENTARY NOTES: Use for additional explena-
- 12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory aponaoring (paying for) the research and development. Include address.
- 13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional apace is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented sa (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the auggested length is from 150 to 225 words.

I4. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
